Definitions, manual compared to How do definitions work for women who deviate from the conventional body shape. Does the measuring instrument matter. Waist is conventionally understood to be a measurable zone within the abdominal region of the torso, a zone of considerable importance. There needs to be a good consistent waist definition, one accurate and valid for everyone. Incorrect definition and measurement will result in technical errors, commercial wastage and customer dissatisfaction. This paper investigates the waist's location and size from the point of view of garment construction for 90 adult women scanned and manually measured in a breast reduction study at Flinders Medical Center, South Australia. There are differing definitions of the location of the human waist as well as different measuring instruments. Substantial discrepancies between the results from these two

locations definitions were found. The choice of instrument used seriously affects the measurement obtained. There is a clear need to modify ISO waist definition for garment construction to include the full range of anatomical variation encountered amongst women. Select this link to jump to content.

It provides an explanation of the philosophy of the PJM Operating Agreement, the role of PJM, a description of PJM participants and their role in the Members Committee. A description of training programs for PJM system operators is also included in M40. The contents of this document are contained within the Definitions section of the Operating Agreement, Open Access Transmission Tariff and Reliability Assurance Agreement as well as the Glossary. It has been PJM's practice to bring revisions to the Manuals through the stakeholder process for endorsement of revisions, but PJM retains the right and responsibility to make changes to the Manuals as necessary, should stakeholder endorsement not be attainable. Manual revisions should be prepared along with the draft governing document revisions associated with the resolution for issues under consideration in the stakeholder process. The Markets and Reliability Committee provides final endorsement for all Manuals, with the exception of Such proposed Manual revisions are usually associated with issues being considered in the stakeholder process however, standalone revisions may be proposed as well. If a member wants to propose a Manual amendment, the member representative is free to make such proposals yet needs to provide justification within the committee structure for why the change is needed. See PJM Committee Structure. This is in contrast to automatic or automated trading which employs programs that originate trades based on human instructional criteria. Manual traders often employ computer programs in order to consolidate information. In some cases, they may also set automated indicators to alert them of potential trading opportunities. However, in all cases, human input is required to authorize trades when manual trading. Manual traders are often still assisted by programs and technology in making their trading decisions. Manual trading and automated trading both have pros and cons.

It's up to each person to decide what works for them. Some traders believe that manual trading is superior since human judgment is required to gauge market trends and control risk. They feel that the proper place for automation is in monitoring data and consolidating it for human interpretation. Automated trading is also based on rules and statistics, whereas manual trading may be based more on emotion. This doesn't always have to be the case though, as a manual trader can base their strategy on sound logic, statistics, and discipline. Automated systems still need to be built by a human, which means they are still prone to human error, except the errors occur in the programming code and not in the execution of the code. Automated trading typically reduces the number of errors, such as fat finger mistakes which are more prevalent in manual trading, yet errors still occur in programming or implementing an automated system. The most obvious example is the Flash Crash of May 2010. The Dow fell nearly 9% in a matter of minutes. Since then, investors and money managers have not forgotten the destabilizing market potential of computer-driven investment strategies. This is when an investor purchases investments they believe will appreciate in value over the long term. Since trades are infrequent, they are often done manually when an opportunity arises. The investor may sell at a predetermined price, or when a technical indicator or fundamental indicator shifts to indicate it is time to exit. The general idea is to capture the bulk of an expected price move, during a trend or price range, and then get out and move on to the next opportunity. He looks for opportunities to enter strongly trending stocks around the 100-day moving average MA, and then also uses the 100-day MA as his exit. Subjectivity doesn't translate into an automated system very well. It needs to be in an uptrend.

This helps avoid the whipsaw scenarios which occur when the price moves back and forth across the MA as it moves sideways. It dropped briefly below the 100-day, creating a bit of space below the line, and then moved back above. Jim bought. Toward the end of that year, Jim sold when the price crossed back below the 100-day. Jim bought again. This trade lasted most of the year until the price dropped below the 100-day again. Jim sold his position. He had to sell a few days later as Netflix stock continued dropping. By this point, the uptrend was in question, and the price was whipsawing the MA. This is a situation Jim likes to avoid and therefore opted not to trade any of the crossovers that occurred in the rest of 2018 and 2019. This type of subjective decisionmaking is very hard to program into a computer. Therefore, Jim likes to place all his trades manually. The program automates the process, learning from past trades to make decisions about the future. When to sell has a huge impact on performance. Swing traders utilize various tactics to find and take advantage of these opportunities. First, a new web-based format see below that is easy to access and navigate; and second, the traditional PDF format. In 2008, in an effort to increase transparency of informal staff interpretations, the Division posted a version of the Manual to its website. Because of its informal nature, the Manual does not necessarily contain a discussion of all material considerations necessary to reach an accounting or disclosure conclusion. Such conclusions about a particular transaction are very fact dependent and require careful analysis of the transaction and of the relevant authoritative accounting literature and Commission requirements. The information in this Manual is nonauthoritative. If it conflicts with authoritative or source material, the authoritative or source material governs. The information presented also may not reflect the views of other Divisions and Offices at the Commission.

The guidance is not a rule, regulation or statement of the Commission and the Commission has neither approved nor disapproved this information. The information included in this Manual may be updated from time to time and positions may change. As a result, some of the information in this manual may not be up to date. Previous updates are marked using the same convention and represent the last revision to that section. We include a date tag when the change is significant. Changes that are administrative in nature for example, section reference updates or grammatical

A company is small if it meets the "staff headcount" test and at least one of the requirements of the "turnover" or "balance sheet total" tests. The figures to be aggregated are based on the proportion of capital or voting rights held by the linked enterprise. It does not refer to the net assets position.

As with any of the thresholds, companies close to the limit should not rely on changes to the exchange rate but should plan in advance to meet the requirements if any which changing designation requires. This calibration process has been conducted in several states and many questions have been raised as a result. This paper is intended to investigate different definitions and criteria for the calibration factors, and provide recommendations for practitioners on which definition to use. In addition to the calibration factors in the HSM and previously published definitions, two other calibration factor equations are proposed and compared using multiple goodness of fit measures. Whereas each definition may outperform others in certain measures, in this study, it is recommended to use the definition that maximizes the likelihood between predicted and observed crashes. The idea is to follow the same concept in both statespecific safety performance functions development and calibration process, which is maximizing the likelihood of predicted and observed crashes.
